

# ANIMAL DISEASE DIAGNOSTIC SYSTEM

MAINA JESSICA - 101995

# BACKGROUND

Agriculture is key to Kenya's economy. According to the Food and Agriculture Organisation, agriculture contributes to 26 per cent of the Gross Domestic Product (GDP) and another 27 per cent of GDP indirectly through linkages with other sectors. The Livestock sub-sector contributes about 10% in the national GDP, 50% in the agricultural GDP. The third major challenge that the agricultural sector faces, according to Kenya Agricultural Research Institute, is pests and diseases.

Kenya - GDP share of agriculture

Kenya - Livestock production index

# PROBLEMS

- Lack of access to veterinarians
- Misdiagnosis
- Late diagnosis and precautions taken

# JUSTIFICATION

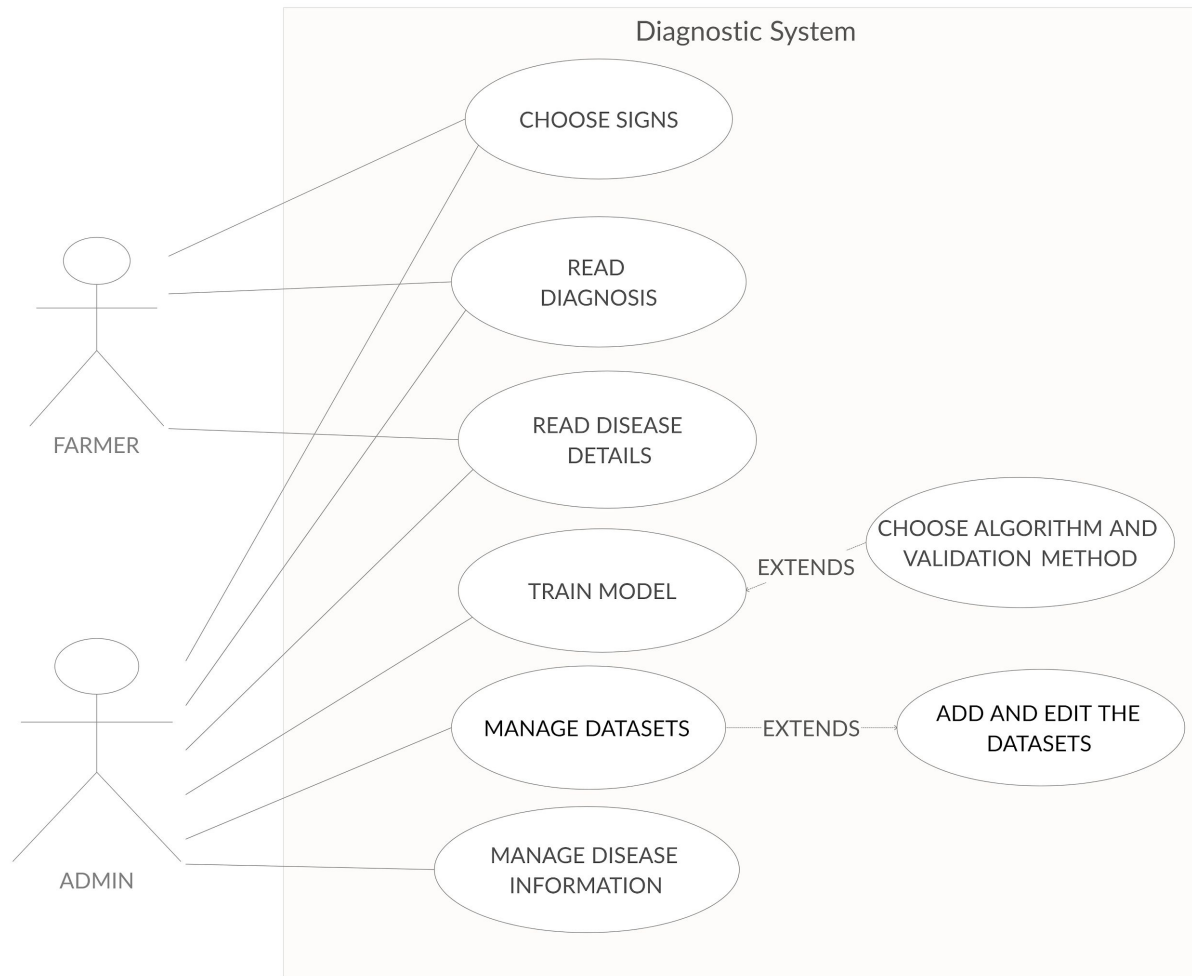

Early disease diagnosis is important in disease management. Currently, most farmers have troubles in getting quick consultation and diagnosis. With this system, an early diagnosis can be made by the farmer when they notice an animal is sickly. They then can act appropriately and enforce measures such as quarantine and isolation quickly before a veterinarian is available. They can also start changing the animals' lifestyle so as to not make the animals suffer. This reduces risk of outbreaks and death of animals. This system can also be used by veterinarians or community based animal workers as a reference in case they forgot or unsure of their diagnosis

# OBJECTIVES

1. ANALYZE THE SYMPTOMS
2. PROVIDE DISEASE INFORMATION
3. CLASSIFY A PARTICULAR SYMPTOM

# USE CASE

# MODELS USED

For diagnosis: Random Forest is used

For the individual symptoms: Convolutional Neural Network is used
